ABSTRACT

The amount of money people spend on food, beverages, and tobacco is an excellent measure of a country's standard of living. Comparing U.S. food expenditures with those of other countries entails putting the statistics on a common ground. This series of tables and charts relates food, beverages, and tobacco statistics to the U.S. dollar and to disposable personal income, a unit of account not readily available for foreign countries. Comparisons show that dollar for dollar, U.S. consumers spend smaller portions of their paychecks for food than anyone else in the world.

Keywords: Food expenditures, beverages expenditures, tobacco expenditures, disposable personal income, personal consumption expenditures, food as a percent of DPI, dollar equivalent food, beverages, and tobacco.

ACKNOWLEDGMENT

The author wishes to express thanks to Nancy Kenney for creating the charts and to the staff of the Eastern Europe Branch of the Economic Research Service for the table on Eastern Europe and USSR.

U.S. and World Food, Beverages, and Tobacco Expenditures, 1970-83

Penelope Korb

You are what you eat. Nowhere is this phrase more relevant than in appraising international food expenditures. How much people spend on food, beverages, and tobacco plays a major role in determining how they live. A country's standard of living is often measured through its food expenditures. The smaller the share of income people spend for food, the more money is available for other purchases and savings. This publication gives a glimpse of life abroad. It also shows that U.S. consumers spend a smaller portion of their budgets for food, beverages, and tobacco than anyone else in the world.

The information presented in this report comes from two sources: The Organization for Economic Cooperation and Development (OECD) publication entitled *National Accounts, Detailed Tables, Volume II, 1971-83* and the United Nations (U.N.) publication *National Accounts Statistics: Main Aggregates and Detailed Tables, 1982*. Data for Eastern Europe and USSR are provided by the Economic Research Service (ERS).

This report provides as much individual country data as possible concerning food, beverages, and tobacco expenditures. Why food, beverages, and tobacco as a group? Because this broad category is included in the U.N. system of national accounts, and data are available for all countries. This category represents the agricultural portion of personal expenditures. For most countries, this series is further broken down into four components: food, nonalcoholic beverages, alcoholic beverages, and tobacco. The 55 tables and charts reflect the breakdown within the food, beverages, and tobacco category. Not all countries separate the subcategories, and some combine the components differently. However, every effort has been made to make the data series as consistent as possible.

This report includes other economic series that assist in relating food, beverages, and tobacco expenditures to a nation's economy. The gross domestic product category reflects all goods and services produced by a country in a given time period. It is the broadest measure of a country's ability to produce. These data are available for all countries from both the OECD and the United Nations.

The personal consumption expenditures (PCE) category consists of household expenditures for nondurable goods (food, beverages, and tobacco), durable goods (clothing and automobiles), and services (rent and entertainment).

This category represents the amount spent on consumable goods in a given time period. These data are readily available for all countries.

Disposable personal income (DPI) is the economic account representing potential expenditures. It includes both what was consumed (PCE) and what could have been consumed but wasn't (net savings). It represents the total money individuals have available to spend. This series is not readily available and has been calculated by ERS.

All food, beverages, and tobacco categories refer to at-home expenditures and do not include money spent at restaurants.

Most country-to-country comparisons involving food expenditures are based on PCE. Food, beverages, and tobacco expenditures are measured against a person's total consumption expenditures. A more important relationship comes to the surface, however, by comparing these expenditures with what the household has available to spend. That is, food consumption relative to money *available* rather than food consumption relative to money *spent*. DPI is the account representing just such a notion. Whenever possible, food, beverages, and tobacco expenditures are calculated as a percentage of DPI. When DPI data are not available, PCE data are used.

The easiest way to relate food expenditures to our everyday lives is to measure how much of our paycheck goes to food. This may be measured two ways: 1) show food expenditures as a percentage of available money (DPI); 2) compare actual food expenditures on a common level, by converting foreign currencies to U.S. dollars. The following tables present food, beverages, and tobacco both ways: as a percentage of DPI and dollar equivalent amounts for each country. The dollar equivalent values are calculated using exchange rates from the International Monetary Fund. These figures are then further reduced to per capita amounts by factoring in population. The population figures used in the per capita calculations are from ERS.

Some countries have been omitted for lack of data, and some tables and charts are narrow in their coverage. Several factors help explain the lack of data for certain areas:

- o In some regions (such as Latin America), inflation makes it nearly impossible to compile a meaningful series of economic indicators.
- o In other regions (such as Africa), the undeveloped economies lack national accounting systems.
- o In the centrally planned economies of the USSR and Eastern Europe, detailed economic series are not readily available. In this case, a modified table is presented (table 54).

For those who wish to see how the United States compares with the rest of the world, a summary table is provided (table 55). The countries included in this table are ranked by per capita DPI. Although the United States does not have the highest per capita DPI (Switzerland does), U.S. consumers spend the smallest portion of their incomes for food.
